

Step 1: Install & Open Android Studio

1. Download and install **Android Studio** from the official site: <https://developer.android.com/studio>.
 2. Launch **Android Studio** after installation.
-

Step 2: Start a New Project

1. On the **Welcome Screen**, click "**New Project**".
(If an existing project is open, go to **File** → **New** → **New Project**).
-

Step 3: Choose a Project Template

1. Select a template based on the type of app:
 - **Empty Activity** (recommended for beginners)
 - **Basic Activity**
 - **Bottom Navigation Activity**
 - **No Activity** (if you want to start from scratch)
 2. Click **Next**.
-

Step 4: Configure Project

1. **Name**: Enter a name for your app.
 2. **Package Name**: This is a unique identifier (e.g., `com.example.myapp`).
 3. **Save Location**: Choose the folder where the project will be saved.
 4. **Language**: Select the programming language (Kotlin or Java).
 5. **Minimum API Level**: Select the lowest Android version your app will support.
(For better compatibility, **API Level 21 (Lollipop)** or higher is recommended.)
 6. Click **Finish**.
-

Step 5: Wait for Project Setup

- Android Studio will **download dependencies** and configure the project.
 - Once setup is complete, the **MainActivity.kt (or .java)** file and layout (`activity_main.xml`) will be available.
-

Step 6: Run the App

1. Connect a **physical Android device** or use the **Emulator**.
2. Click the **Run ()** button to build and launch the app.
