

INTELLIGENT AGENT

Presented by:

Prabin Chaudhary

7th , sem

NAST College, Dhangadhi

AGENTS

- An agent can be anything that perceive its environment through sensors and act upon that environment through actuators.
 - An agent runs in the cycle of perceiving, thinking and acting.
- 
- A series of several parallel white lines of varying lengths and positions, all slanted diagonally upwards from left to right, located in the bottom right quadrant of the slide.

SENSORS, ACTUATORS AND EFFECTORS

SENSORS, ACTUATORS AND EFFECTORS

- **Sensors:** Sensor is a device which detects the change in the environment and sends the information to other electronic devices. An agent observes its environment through sensors.
- **Actuators:** Actuators are the component of machines that converts energy into motion. The actuators are only responsible for moving and controlling a system. An actuator can be an electric motor, gears etc.
- **Effectors:** Effectors are the devices which affect the environment. Effectors can be legs, wheels, arms, fingers, wings, fins, and display screen.

INTELLIGENT AGENT

- An intelligent agent is an autonomous entity which act upon an environment using sensors and actuators for achieving goals.
- An intelligent agent may learn from the environment to achieve their goals.
- A thermostat is an example of an intelligent agent.

A THERMOSTAT IS AN EXAMPLE OF INTELLIGENT AGENT.

- **Perception:** A thermostat senses its environment through a temperature sensor. It perceives the current temperature in the room.
- **Action:** Based on the perceived temperature and the desired temperature setting, the thermostat takes action by controlling heating or cooling system.
- **Goal:** The thermostat's goal is to maintain a specific temperature in the room.
- **Autonomy:** Within its limited scope, the thermostat operates autonomously. It doesn't require constant human intervention to make decisions and execute actions.

THANK YOU!!!
